APPLICATION FOR LUMEN MAINTENANCE TESTING ACCORDING TO THE IESNA LM-80 TEST STANDARD

Prepared for: Shen zhen Runlite Technology Co., Ltd5F east, 3 building, Tian Fu An Industry Zone, Le ZhuJiao, Xi Xiang,
BaoAn District, ShenZhen, GuangDong Province, CHINA**Description of the submitted sample(s):**

Sample Name : White SMD LED
Sample Model : YL-T3528 W-AA-60C
Ratings : 20mA, 6.5lm, 75(Ra), 6000K
State of Sample(s) : Normal
Sample Quantity : 60pcs
Manufacturer : Shen zhen Runlite Technology Co., Ltd
Reference Standard : IESNA LM-80-2008 Approved Method: Measuring Lumen Maintenance of LED Light Sources

Sample Received Date : Jul. 14, 2011

Sample Tested Date : Jul. 15, 2011 to April 23, 2012

Tested by : Kaiser Lee

Prepared by: Centre Testing International Corporation

NO.1996, Xin jin qiao Road, Pudong New District, Shanghai, 201206, China

Note: The laboratory that conducted the testing items in this report has been accredited by the National Voluntary Laboratory Accreditation Program (NVLAP LAB CODE: 200889-0), for LM-80 testing of LED Light Sources.

Page 3 of 10

3 TEST METHODS

3.1 Requirements of Environmental Conditions

Operation of the LED light sources between photometric measurements shall be at a minimum of three case temperatures, T_s , using the same drive current. The three case temperatures, T_s , shall be 55°C and 85°C with a third temperature selected by the manufacturer. Case temperatures shall be controlled to -2°C during life testing. The temperature of the surrounding air should be maintained to within -5°C of the case temperature during testing. The surrounding air temperature should be monitored within the test chamber. Humidity shall be maintained to less than 65%RH throughout the life test.

The case temperature T_s is the cathode lead temperature of the LED mounted on a reliability test board. The ambient temperature T_A is the temperature of the air at a distance of 50mm above the reliability test board.

The ambient temperature during lumen and chromaticity measurements shall be set to 25°C ± 2°C. The LED light source shall be required to cool to room temperature prior to measurement.

Airflow shall be minimized for proper light source starting and operation.

The operating orientation of the LED light sources under test should be as specified by the manufacturer.

3.2 Lumen Maintenance Testing Method

Samples under test shall be driven for at least 6,000 hours with data collection at a minimum of every 1000 hours. 10,000 hours are preferred for the purposes of improved predictive modeling.

LED light sources are driven at constant current.

Checking for LED light source failures either by visual observation or automatic monitoring shall be done at a minimum of every measurement interval. Catastrophic LED light source failure shall be reported and included in the test report.

The chromaticity shift shall be measured and reported over the course of the lumen maintenance test time by measuring chromaticity at each photometric test interval.

3.3 Photometric and Electrical Measurements

A Labsphere Model CDS 2100 CCD Spectroradiometer and 50cm Integrating Sphere was used to measure total luminous flux, correlated color temperature, color rendering index, and chromaticity coordinates for each sample.

Ambient temperature was measured at a position inside the integrating sphere. Electrical measurements including voltage, current, and power were measured using the Digital Power Meter.

The uncertainty of the light output measurement is U=1.5% (K=2), at the 95% confidence level. The uncertainty of the correlated color temperature measurement is U=14K (K=2), at the 95% confidence level. This calibration results traceable to the NATIONAL INSTITUTE OF METROLOGY (NIM).

Test Report

Report No.: SHES1107041295605

Page 8 of 10

4.3 105°C, 20mA

Case Temperature [T_s] : 104.9 °C

Ambient Temperature [T_A] : 104.2 °C

Drive Current [I_F] : 20 mA

Measurement Current : 20 mA

Failures Observed : None

No.	Φ_v [lm]	V_F [V]	Lumen Maintenance [%]
